

Facade Design Pattern (scaffold)

This module is a **placeholder** — the pattern is not implemented here yet. The full, runnable, production-mirrored example lives in `Design-Pattern-RealUseCase/RealUseCase_Structural/RealUseCase_Facade_Design_Pattern`.

Target UML (what the implementation should look like)

Current code, line by line

```
package com.design.patterns.facade;

public class FacadeDesignPattern {

    public static void main(String[] args) {
        System.out.println("Facade Design Pattern");
    }
}
```

- `package com.design.patterns.facade;` — the pattern's dedicated package, ready for the real classes.
- `public class FacadeDesignPattern` — the module's entry class, named after the pattern.
- `public static void main(String[] args)` — standard JVM entry point so the scaffold runs standalone.
- `System.out.println("Facade Design Pattern");` — prints the pattern name, proving the module builds and runs; replace with a real demo when implementing.
