

Mediator Design Pattern (scaffold)

This module is a **placeholder** — the pattern is not implemented here yet. The full, runnable, production-mirrored example lives in

Design-Pattern-RealUseCase/RealUseCase_Behavioral/RealUseCase_Mediator_Design_Pattern.

Target UML (what the implementation should look like)

```
ColleagueA \ / ColleagueC +--> Mediator <+ ColleagueB / (routes all \ ColleagueD
interaction; colleagues never call each other)
```

Current code, line by line

```
package com.design.patterns.mediator; public class MediatorDesignPattern { public static
void main(String[] args) { System.out.println("Mediator Design Pattern"); } }
```

- `package com.design.patterns.mediator;` — the pattern's dedicated package, ready for the real classes.
- `public class MediatorDesignPattern` — the module's entry class, named after the pattern.
- `public static void main(String[] args)` — standard JVM entry point so the scaffold runs standalone.
- `System.out.println("Mediator Design Pattern");` — prints the pattern name, proving the module builds and runs; replace with a real demo when implementing.
