

Adapter Design Pattern (scaffold)

This module is a **placeholder** — the pattern is not implemented here yet. The full, runnable, production-mirrored example lives in `Design-Pattern-RealUseCase/RealUseCase_Structural/RealUseCase_Adapter_Design_Pattern`.

Target UML (what the implementation should look like)

```
<<interface>> Target      +-----+
| +request() |<---- client | Adaptee (foreign)|
+-----^-----+      | +foreignCall() |
| implements      +-----^-----+
+-----+-----+ delegates & |
| Adapter |---- translates -----+
+-----+-----+
```

Current code, line by line

```
package com.design.patterns.adapter;

public class AdapterDesignPattern {

    public static void main(String[] args) {
        System.out.println("Adapter Design Pattern");
    }
}
```

- `package com.design.patterns.adapter;` — the pattern's dedicated package, ready for the real classes.
- `public class AdapterDesignPattern` — the module's entry class, named after the pattern.
- `public static void main(String[] args)` — standard JVM entry point so the scaffold runs standalone.
- `System.out.println("Adapter Design Pattern");` — prints the pattern name, proving the module builds and runs; replace with a real demo when implementing.
